

CATALOGUE BROWSER

IMPLEMENTATION INSTRUCTION

Paste the html code into the code of your website to a location where you want the catalogue browser to appear. The table with search results will appear below, but you can change the position using '**drag and drop**' method.

Create an empty file named **zap_remote.js** and copy into it the contents of the 'js' box. Place this file on the server **in the same location as the other javascript files**. Return to the 'html' code pasted earlier into the website, find (somewhere at the beginning) the line with the following content:

```
<script type="text/javascript" src="zap_remote.js"></script>
```

and modify the src attribute so that it points to the location of the zap_remote.js file you just created. **In order for the catalogue browser to run you will need to instal JQueryUI library**. It can be downloaded for free from: <http://jqueryui.com/download>.

Create an empty file named **zap_remote.css** and copy into it the contents of the 'css' box. Place this file on the server **in the same location as the other css files**. Return to the 'html' code pasted earlier into the website, find (somewhere at the beginning) the line with the following content:

```
<link rel="stylesheet" href="zap_remote.css" type="text/css" />
```

and modify the href attribute so that it points to the location of the zap_remote.css file you just created.
